Ask about our price match guarantee!

Prior to purchase or within seven days of purchase, should you find a lower price, we will match that price and beat it by giving you an additional 10% off.

Customer must present original sales receipt along with (or) proof that the item is being sold at a lower price. We reserve the right to verify that the pricing is correct and that the merchandise is identical (same internal parts, model, country of origin, quantity requirements etc). This price match guarantee is subject to the verification of competitor's promotional offers, typographical errors, special orders, rebates, clearance/surplus or close out prices. Competitor's must be in North America and in Canadian dollars based on the appropriate exchange/shipping rates. This offer cannot be combined with any other offer and must be a stocking item at the specific location. Remanufactured product is only price guaranteed against Bendix® and Haldex® pricing. Steps for Rotor Identification:

Rotor manufacturers use different FP Part #s across the industry and vehicle manufacturers may use several different rotors for one application. The easiest way to identify your rotor is to find these measurements:

- Outside Diameter across the face of the disc
- Rotor Thickness. Every rotor has a OE spec for New and Minimal Thickness. (Minimum is stamped on rotor.)
- Overall Rotor Depth from top of hat or flange to opposite rotor face.
- Pilot Diameter
- Bolt Circle Diameter measured from center of bolt holes.
- Bolt Hole Size and Count
- Note rotor style and ABS ring configuration. Some rotors will have same measurements but be a different style.

CORROSION PROTECTION

All of our rotors are treated with Geomet® 400 coatings

All of our rotors are treated with Geomet® 400 coatings significantly extending rotor life. Applied in layers of 8 - 10 microns thick, this blend of zinc and aluminum oxides interlace and bind to the metal surface so that they are four times more corrosion resistant than zinc-only coatings. Feel confident knowing your rotors are protected from typical corrosives such as: Road Salt - Magnesium Chloride - Kerosene - Gas - Diesel - Calcium Chloride - Brake Fluid - Brake Clean - Antifreeze - Ammonia - Alcohol and Acid Wash.

Facts you should know about the Never Adjust System Brakes

The two main types of ELECTRIC BRAKE ASSEMBLIES for axles 7K and below are Forward Self Adjusting (FSA) and Manual adjusting. The difference between the two is that the forward self-adjusting brakes will adjust themselves as needed so that they are always at the optimum position. Manual brakes must be adjusted manually via the star adjuster on the backside of the brake assembly as needed. Due to the reduction of required maintenance, the FSA brakes are becoming a lot more popular.

It is important to be able to identify which type is already on your trailer so that maintenance or replacing is done correctly. This cannot simply be done by looking for a star adjuster because both types have that. The FSA brakes will have a wire that will run from about 9 o'clock to 1 o'clock. On the 1 o'clock side it will have a banjo looking fitting. The manual adjusting brake will not have this wire running across the inside of the assembly. Another way to identify between the two is the bottom spring. On an FSA brake assembly the spring will be straight and wrapped around the adjuster. On a Manual adjusted brake assembly it will be a curved spring below the adjuster. Due to the way that these brakes operate we absolutely recommend being consistent through the trailer. It is NOT SAFE to run both types of brakes on the same axle. It is NOT RECOMMENDED to run both types of brakes on the same trailer (different axles) but if the brakes on each axle match, it is operable. Problems will occur if one side of the trailer is adjusting automatically and brakes on the other side are not. A final thought about FSA brakes assemblies. It is important to keep in mind that FSA brakes are automatically adjusted to perform at their best. This means they may not last as long as manually adjusted brakes. This is because manually adjusted brakes, if not adjusted regularly, are not being used to their potential and the shoes wear slower.

☆ Fleet Products is now offering Coalescing Dryers & Cartridges for Model 9 & Model IP Style Dryers. Technically speaking, Coalescence is the process by which two or more droplets, bubbles or particles merge during contact to form a single daughter droplet, bubble or particle.

What does this mean to you? With the EPA '07 and EPA '10 emission standards the cost of commercial vehicles continues to rise due to some major technical advancements. By using coalescing filters the life of these systems can be dramatically increased, saving thousands of dollars in maintenance costs. Also the efficiency of the filter is increased by removing the oil which decreases the desiccants ability to remove moisture. (see figure 1 on page 12)

Air Suspension, Control Boxes & Gauges

CONTROL BOXES

Used to manually exhaust the air from the suspension of an air ride trailer. Control boxes can be ordered with custom valving. An optional gauge indicates the air pressure in the suspension, which may be used to calculate load weight. All units contain U.S. D.O.T. approved components.

We custom design & build air lift axle control boxes for trailers. We can produce specific boxes for various applications in Stainless Steel, Black Powder Coated, Steel or Composite Material. Please call for further information.
